What is your vision for the future of the university?

1

0:00:12

Well, I imagine the university in the future as much more international than it is today, although it's quite international these days. We're facing demographic issues, which are really troublesome so I think internationalization will be a very important tool for the sustainability of universities. I imagine universities as more hybrids in the way of teaching and learning so I imagine technologies as a key factor in teaching and learning. Of course I think EI will be key as well. So students will have access to information quite fast. And that is relevant in the sense that we also need to adapt the way professors teach, right? So we will have more problem-based, challenge-based approaches in teaching and learning because universities will be a place, a more experiential place and less of a content-based place. So it will be much more collaborative. People will work in groups more often than they do today to try to solve problems, challenges, mostly global challenges. I think all universities will be very devoted to solve global challenges we all face. And so this is what I foresee for universities for the future. Just for one final point, I also think universities will have less less barriers than they have today. If we think about the EUA vision for 2030, for example, universities without walls, that's what I mean with that. So besides being more multicultural, universities will also be in a more intense relationship with society, in the sense that we will all contribute. This will be an ecosystem that we will all contribute to solve societal we will all contribute. This will be an ecosystem that we will all contribute to solve societal challenges that we are all facing and will be facing more and more in the future.
