We often believe that students change and this is really true because of course if I My son, he was introduced to digital technologies more than I was in the past. My father, who was an engineer like me, uses different technologies, different as a student also, not only as a professor. But there are some characteristics that, in my opinion, will be the same now and in the future. Students have to be surprised by the knowledge, have to be amazed by the knowledge. a common characteristic now and in the future. Of course, how can I surprise a student in 1993 is really different from the way I can surprise a student in the past and 20 years from now. I am convinced that I've seen what happens during the call upon the pandemic. And I've seen that one.

More than the interaction between teacher and students. And this, in my opinion, will be real also in the future. So, the future of the cooperation between students. the activities carried out in group, discussing together and are, my opinion, we characterize more than now the work in the future. are more suited in learning from videos, from some instruments different from the one in which we studied. We studied in books. They studied at least in e-books or a multimedia information systems. So this is will be the main differences in the future. There are some other difference that deal especially Especially with some particular topics.

I learned. And these activities are important now, where important in the past, and the my opinion will be important in the future of course, in the past instrument has to be driven by some other thing that I cannot imagine but I think that also in the future we need the instruments. There will be instruments to measure quantities and students have to learn how to do this. They will learn sharing their experience, sharing activities, discussing, suggesting one each other. Also, of course, also with the teacher, but as I have said before, the greater difference in distance learning, respect, respect present learning is the impossibility of interacting or the reduction of interacting with one each other. Of course, 20 years from now, we will have also, at least in Italy, a reduction of the number of students. And this reduction, because there are less, more, less people that go, so a reduction of people in Italy.

But in the framework of the shared university system with cooperation, also the interaction between students in different camps will increase and will improve also the learning results of each student.
