I believe that in 20 years the university will change a lot because if the situation of the last 10-15 years, we will have a university that is always more internationalized. I mean, up to 10-15 years ago, at least in Italy, we had not so many foreign students. 15 years ago, 20 years ago, it started some presence of students coming from other countries, and it's going to increase. I mean, all the universities have nowadays a number of foreign students increasing. So sure, the university will be much more inclusive of different nationalities, and also coming from country very far from Europe and from Italy.

Turing is an example for that, but not only Turing, all the Italian universities are always more with the presence of international students. Of course, the tools that we use in the universities have been changing a lot in the last years. Today, after pandemic, because pandemic was very important for that. We discovered that there is the possibility to make a part of, only a part, at least only a part of the total classes dot in presence, in distance, and the number of classes where a part of the lectures is given by computer is increasing. So also the tools are changing, are changing a lot.

And this makes easier the approach to the university for the students, even if people just like me that more or less are a bit more traditional are also worried for that because I believe that the lecture in presence is always something very, very different than the lecture using a computer. So I believe that, of course, it's nonsense to refuse new technologies and these new possibilities to enlarge the number of students all over the world. It's a nonsense. But we have to be a bit worried about the quality of our courses, and the quality of the courses is still today, in my opinion, very strongly dependent on the lecture, on the relations that there is between the professor and the class. This is very important. is increasing in importance is the use of artificial intelligence but also other new learning technologies based on augmented reality.

It can be very, very important for our universities. I am thinking, for instance, to the field of medicine, but not only. You have the possibility to simulate a lot of new work environments and so it's possible using these technologies to improve a lot the quality of education. This is important, this is something that in the future will grow. I think going to some fields just like medicine, I remember that up to 20 or 30 years ago a lot of learning was made in the hospital, was made working directly on the patients. Nowadays the use of augmented reality can really introduce something useful, something important for the students. So I believe that these things will change a lot of differences and I'm sure that in the next 20 years we will have the same differences in the sense that they will grow, they will increase and there will be a lot of changes in the next 20 years.
