So, good afternoon and I think that in the future the prevailing activities will be still He may believe that the work in presence is going to be very important, even though modern technologies always allow a certain part of the activities in terms of activities related to learning new skills and new abilities with respect to activities that are related to soft skill and cooperation abilities of the students themselves. From this point of view I think that in the classroom, so more related to processes like one in the classroom in which the students are driven in some way by professors in terms of material and tools that can provide themselves technologies technologies and support for learning the most say technical part of technical stuff and then a large part of the activities in the classrooms may be devoted to activities like learning by doing or group works or activities in which the interaction between the professors and the classroom itself is much stronger than in conventional teaching. And from this point of view, I believe that the process of the development of the abilities by the students is very much related to this interaction. And this interaction will be in the classroom, will be facilitated by many emerging technologies that allow a direct interaction during the class itself. So in my opinion, if the university will be able to provide the right tools to show the possibilities in terms of individual learning, then the activities in the classroom may be devoted much more to collective practices is going to be important for several activities that nowadays are yet present within the university, activities related to multidisciplinary activities, team works, student teams and whatever. aspect is that still say the disciplinary content is going to be important anyway. Part of this disciplinary content may be provided to the students in different forms as nowadays there is an access to information and to technical contents that is widely diffused. The main problem that I see in the future is related to the fact that the amount of information that is circulating around for students is a very large mass of information. So students still will need professors to help them in finding the right sources of information and find the appropriate content. So I think that from this point of view, the role of professors will be slightly different, but still it is going to be very important that they have to be able to provide the right guidance. And I believe that universities cannot just resolve to remote contents. It is important to have that still as part of our activities in presence, even in the future. as part of our activities in presence, even in the future.
