|0.00|> Thank you so much for those questions. Actually, when I'm thinking about the future, I think<|19.56|><|19.56|> the most important trend which will impact significantly on the high institutions and education would be artificial intelligence and writing I suppose and this is why I think actually it will be like a crucial competition among you know new gradients and artificial intelligence you know possibilities and that know, possibilities. And that is why actually the universities could become like a center for competencies in terms of the, you know, developing like a shorter, I mean, short programs instead of five year educations. It's just, you know, my imaginations about the future. all new knowledge will be very quickly old and outdated. And that is why I think they need to, first of all, the professors should have more knowledge, not only about, and should actually gain new knowledge in a very fast mode.

0:01:34

And this is why, actually, in order to provide and to teach students all those competencies and skills and knowledge actually, I think it should be a very quick process. Moreover, I think the focus of skills and competencies would change also. For instance, I think what is more important would be their critical thinking and how people actually should critically assess and analyze their overall environment in order to understand which particular knowledge and skills do they need. Yeah, it's just, of course, I'm not sure that it will be, you know, in 20 years, however, I think we can now observe some trends and some, you know, which is going on in this direction. The first trend is that knowledge actually is becoming more and more outdated every day and that is why actually the key role of the professors would be to teach students how to critically assess all those knowledge and how to navigate in this environment.
